

# THE ULTIMATE HEARTWORM PREVENTATIVE AND CURE

The fact is there has always been natural remedy for pretty much any and all sickness - available to us on our fascinating planet. They have always been there. Many just needed to be discovered and adapted is all. Take, for example, the ability of an individuals' pet being completely cured of a parasite/disease naturally, which otherwise would do the pet in to an early death.

The herbals that are brought together on these pages for this purpose have been around for centuries. Essentially there are over 87,000 herbals available to you! Granted we will only need to touch on a dozen or so here. You may just now be dipping your toes into the eye-opening information of which you are about to benefit greatly from. Or perhaps utilizing herbals in some capacity is familiar ground for you. Skepticism could be at an all-time high and that's fine and quite expected. But every ingredient that we are going to focus on here is real, is easy to obtain, and **will heal** in the ways in which you "cautiously" hope it will.

My goal here is not only to remove your pet from harm's way with regards to all parasitic forms that your pet could be hosting but to also bring light to you the reader. How incredible it will be for you to watch as the next few months pass by that your pet becomes heartworm free and see that the naturopathic way is so real! To hold knowledge that there is a world out there aside from traditional allopathic medicine that works. My goal therefore is to have your family begin its quest as well as your pets' of utilizing an abundant resource for natural healing. Let's get started.

## Understanding the history of each ingredient and why it works

The composition (or mixtures) of the herbal tinctures or powders that are going to be recommended by me for their combined healing characteristics are at least 3 fold. That is, it takes three different herbals to combat heartworms in different stages of their existence in your dog. How is it that I know this? What makes me *so good* at heartworm elimination you ask? The answer is not that I am a pro at knowing the very composite makeup of a heartworm. I have never even seen a real-live heartworm. Just pictures of them, or dead ones in jars at a veterinarian's office, for example. Just like you may have also seen over the years.

What I *do* possess though is an incredible knowledge of a history of learning why a particular natural ingredient is used for something and in this case, a personal yet extensive case history of success with heartworm and overall parasite extraction in animals, including domestic ones of course. I know what is used to destroy "baby" parasites, and I know why that same ingredient might not kill like-kind adult parasites.

I know what works immediately to eradicate something just once, but not shield against its return, and conversely how to protect indefinitely against recurrence of a parasite, or sickness, or a disease for that matter. I know that it's these herbals which are so wicked-harsh to these little internal enemies are in turn so tremendously beneficial to the host that has these same herbals coursing throughout their body. I have been utilizing naturopathic remedy for many years to combat parasites (as well as cancers, diseases, etc.) and now have an opportunity to share knowledge and success with you. **You** are *in hopes* of an easy going road to your dogs' recovery via this information. **Your pet** is more or less *desperate* for it. Fortunately both of you are going to be quite pleased with what you are about to learn.

## The first main ingredient for this road to recovery is:

### Wormwood

Wormwood has been and always will be the main player in the battle of parasitic removal. What is wormwood? It's a plant. Wormwood, or *Artemisia absinthium*, is an herbaceous plant that grows in temperate regions of Europe, Asia and northern Africa.

Typical types of wormwood stems, leaves, & flowers

A Shrub-like perennial, wormwood is usually 2-4 feet high with grey-green leaves and yellow flowers. Wormwood grows naturally in arid, uncultivated ground, near roads, fields, footpaths, and in rocky areas. One interesting characteristic of this plant is that its leaves and roots secrete a substance that restricts the growth of surrounding plants, making it a handy natural way to prevent weeds growing around it. It's likely neighbor while growing is usually more of the same growing close next to it!

In Europe wormwood has been used for hundreds of years secreted into wine and alcohol. The name of this final distilled spirit is called **Absinthe** and quite frankly is well known and is still a popular adult drink today abroad. In the early 1900's Absinthe was banned in many European nations due to its psychedelic effects on the mind. See, a chemical called *thujone* exists within the plant. Thujone Inhibits GABA receptor activation in the brain and in **large** quantities can cause convulsions and even death.

In small quantities it can and will make man slightly delusional. It is for this reason that the U.S. among others banned wormwood in Absinthe use (a main ingredient of Absinthe) and Absinthe sales itself. In 2007, over 75 years later, the U.S. bans were lifted and one can again obtain this spirit. Note though that technology has learned to remove the thujone from the product. The wormwood properties remain.

The Ancient Egyptians swore by wormwood to get rid of their intestinal worms. Yes, wormwood has been utilized for parasitical removal and more for that long of time!

Wormwood is used medicinally for all of the following:

- - the expelling of intestinal parasites (due to its  $\alpha$ -santonin content)
- - aids in digestion
- - stimulates the appetite
- - promotes menstruation
- - use of on infected wounds or exposed ulcers
- - efficacy as an anti-malarial agent.

Hippocrates also prescribed it for jaundice, anemia, rheumatism and menstrual pains. It is used to stimulate bile and gastric juice production and to treat disorders of the liver and gall bladder.

However as much as the Egyptians, Aztecs, etc. knew about parasites, *they did not know* a few key factors about parasite stages; Wormwood will not dispose of:

- Micro parasites,
- 1<sup>st</sup> and/or 2<sup>nd</sup> stage "baby" parasites, (e.g. heartworm stages...),
- Nor parasite eggs.

So if you and poochie are sitting around the house drinkin Absinthe for the purposes of parasite cleansing, you are only barely half way home! Because..

## You will need the 2<sup>nd</sup> ingredient for your pet to be worm free:

### Oil of clove

Having oil of clove is critical when healing your pet from heartworms. **Oil of clove**, also known as **Clove oil**, is an essential oil from the clove plant, *Syzygium aromaticum*. It primarily comes from tropical-to-equatorial regions such as Madagascar, Indonesia, Sri Lanka, for example. It is easy to purchase as an individual ingredient in liquid form (local drugstores, etc.), and is harvested in 3 basic ways; from the clove leaf, clove bud, and/or clove stem.

If you cook much, you're familiar with these common lil' guys

Cloves are probably the most **antibacterial** spices known. Dentists use it very often to numb pain due to infection in patients. It's not that it *numbs* per se, but immediately begins killing the bacteria in the tooth/gum and therefore it seems like it's a numbing agent. Its "lightning quick" healing that is actually occurring for the patient in all reality and few dentists know this fact.

Cloves are **antiseptic** as well. They are carminative (anti-gaseous), warming, and very aromatic. Being extremely **antifungal**, I would say that clove oil gives oil of oregano, the strongest antifungal herbal ever, a run for its money. It's also an excellent respiratory and cardiovascular aid. It is believed to aid in thyroid function as well.

However, including all of those benefits mentioned above there is one further benefit that you are most interested in right now. That is the fact that oil of clove is one heck of an **anti parasitic** agent. Oil of clove makes up a part of my 3 tier attack on heartworms because of this; Its composite make up is so strong that it dissolves the *eggs* of parasites in your dog, or you for that matter, incredibly well. Due to the fact that thousands of eggs are created daily by a given parasite strain, this is a refreshing benefit.

This is part of where I mentioned on my website the additional worm-type (or worm variety) killing properties that I promised you. We certainly know that there are almost a dozen or so parasites, some of which I listed on my site anyway, that potentially live in your pet! The real truth of the matter is that over 100 different specimens of parasites can exist between us humans and our pets. Let's kill and/or prevent them all!

Now above I was just mentioning eggs. It is true heartworms enter a dog already in their 3<sup>rd</sup> stage of life. They are beyond any "egg sized" status right? However they are small enough still in their "microfilaria" stage to get dissolved just as well. And this benefit is critical due to the fact that wormwood alone does not accomplish this task. Technically nor does most of the 87,000 plus other herbs aside from one or two like oil of oregano, for example.

Heck if every dog in your neighborhood had oil of clove in them they would never have been able to give the mosquito *that bit your dog* the stage 1 microfilaria to begin with heh? Oh well, here we are cursing dirty mosquitoes and your neighbors' dogs. No good that will do now, we must keep reading about the final critical herb that will polish off the whole gambit of heartworm infection stages and that will be...

## The final blow to deal to our buddy the heartworm:

### Black walnut hull

Yup, you guessed it. You are getting good at this natural remedy stuff so quick! Oh. You did not guess Black Walnut? No matter. At least you were in stitches wondering what could the 3<sup>rd</sup> item ever be... right? Don't get me wrong there are many more herbs that we will itemize within this report that the providers I have chosen for you to shop utilize in their version of product for your pet. There are a number of factors that I consider when accepting and begin sharing these providers' products for you too. I will go into this more for you shortly.

Black Walnut's green hull is an important part of herbal medicine, and has been used for thousands of years. There are many conditions that the alternative medical community treats on a regular basis. For those like myself who have found success with the use of herbs and alternative medicine, there is no doubt that the use of black walnut's green hull is essential. From the early Roman days to the Middle Ages and beyond, walnut has proven to be vital in helping to treat a myriad of conditions and illnesses.

Black walnut can be found in its broken halved or "chopped" nut form in food stores most anywhere. The largest deposit of Black walnut trees world-wide are found primarily from the central and north-east to south-eastern United States. The largest manufacturer of the nut happens to be located in Missouri.

Do not misconstrue this nut or its sibling "Persian" or "English" walnut and their retail use and exceptional nutritional benefits to the hull itself. These nuts are high in unsaturated fat and protein and have no cholesterol. They offer nearly a half dozen necessary acids such as linoleic and stearic. There is not a better nut across the board for consumption. But nutrition is not what we seek in the name of healing. Not this time. Today we seek parasitic removal, right?

Green hull is far more beneficial to consume by all means when we speak of its *medicinal* use. For its use to be most helpful, the original and best way to extract the herbal healing powers of the hull is to soak it. However many companies now make it available in powder form too (found typically placed in capsules for ingestion). In naturopathic medicine, liquids are generally called "tinctures". Soaking the hull in grain alcohol makes it more potent, but in capsule form, it's a bit longer lasting on the shelf. You will notice later when I begin to direct you to different websites offering the products mentioned here today, that the "hull portion" of the product being shopped by you will be available both ways as there are advantages for you as to how you will administer the herbals to your pet.

**Black walnuts and their green hulls**

What makes this nut's hull, shown here growing high in trees throughout different parts of our planet, so profoundly good for purposes of parasite removal? Let's begin to answer that with a quick explanation of an incredible feature this tree possesses.

The tree itself is found quite often as a shade tree on people's residences, etc. What these people many times notice whilst admiring their handsome tree is that not too many types of other trees or shrubs/plants etc. grow within several yards of it. They may also realize that there never seems to be any insects around or on the tree. This is due to the fact that the tree produces a powerful defensive chemical called juglone all throughout its branches, leaves, hulls, and roots. Juglone is quite toxic to many plant species and insects themselves would rather be somewhere else than in its presence.

When a tree contains any chemical that repels, it is commonly known as containing a "tannin". Add in the fact that the hulls contain a natural iodine (known to support organism cleansing by way of essentially "staining" itself onto said organism and thereby burning it up), and you got a tree that thinks itself a natural "bug spray" and "weed killer" all in one! These actions translate into huge benefits for humans and animals alike when faced with the need for parasite removal. And that answers our question as to what makes the black walnut hull so good.

The more significant question that I have always pondered with this and pretty much all herbal products is; who figured out way-back-when that this "nuts' skin" was so good for us anyways? It's like "Hey I think I'll take this green skin off of that there nut and soak it in some grain alcohol and drink it". "Then record the findings for all of mankind to benefit from".

As silly as the above paragraph seems, I believe that this shot-in-the-dark method of scientific experimentation has gotten us where we are today with the thousands of herbal remedies that is known to heal and

is now available to us in our current day and age. Thank god for persistence and science combined. We might not have computers or even electricity for that matter if it weren't for persistence and blind testing! History of use and record-keeping over time thereto, has proved that an herbal is good for us and in what capacity, and that's good enough. We just needed to get YOU to discover some of this history for yourself and family and have YOU now begin to learn how different herbals work and in what fashion. And I promise you are just barely scratching the surface of what this wealth of knowledge will begin to bring to your household from here on out as long as you desire to continue your personal education beyond this heartworm report.

Thus far we have covered 3 of the most effective, natural, and safest items known to remove heartworms from your pet. Or for some readers we have covered the 3 best herbals to simply continue the mere prevention of heartworms and all other parasites overall from existing in your pet.

That is not to say that these are the only three herbal products that will do the job, there are many quite gifted people across the globe that, through time, have learned to apply some other popular parasite disposal herbals into easy-to-use products for your pet: For example, we do not want to utilize the services of wormwood if our female dog happens to be pregnant at any stage.

This due to history, both scientific and otherwise, that states wormwood has been and is still used in *humans anyway* to abort fairly new pregnancies (or in essence, stimulate a late period i.e.-"natural morning after pill"). The best recommendation for your pregnant dog (being a suspected host of heartworms) is to have her wait the typical 60/65 day pregnancy cycle to pass and begin treatment after the litter arrives.

Do realize though that if she has heartworms, now too does the litter. But *only* in the worm's microfilaria stage will the puppies be carriers. Remember a mosquito must still bite the puppies thereby allowing the final growth stage *of the larvae* to occur *in the mosquito* and it then may go on and bite your neighbor's dogs (or yours again later) to begin the actual adult worm process. This explained on [page two](#) of my heartworm website.

What are the odds of the same mosquito biting your puppies again later you ask? The travel range of a given mosquito from its nest is at max at 5 miles circumference but more commonly within 1 mile. The likelihood is though that the mosquito that bites your puppies the first time can do it again ongoing because its nest is most probably within 1000 feet of your house. If you need proof on that, watch the next mosquito near you - - travel! Or simply trust that someone in the past has already done this for us because as far as science is concerned, the above statement is true! I will reveal some very interesting facts about mosquitoes for you a bit later.

Anyway, if she is pregnant we now may want to use the other two herbals described above without wormwood but maybe combined with elecampane root, or male fern root. Or maybe we choose a provider shown below that utilizes garlic in their product. Any of these examples have wonderful histories of combating parasites. I will further explain some of the definitions, etc. of different herb choices as they arrive in the products below.

The companies that are listed below offer the product(s) your pet needs to rid him/herself from parasites. They are not listed in any particular order but prove to be the best, in my opinion, for having product that is best for eradicating the heartworms in your pet.

**Live Superfoods, Bend, OR**

[www.livesuperfoods.com](http://www.livesuperfoods.com)

**1-800-481-5074**

Ships world-wide, and offers free shipping for orders over \$99

[Item # HFN028, Scram internal parasite formula](#) by “Healthforce Nutritionals”

One of my personal favorite companies to order through, Live Superfoods has been established for many years now. They ship quite quickly and have a large array of products to offer.

The product we are focusing on today is Scram parasite formula. Silly name, exceptional product and creator. Not only does this product contain the 3 necessary elements for what we seek, it contains two additional ingredients that make it an impressive product. **They implement milk thistle seed** and **wasabi extract** into this blend. These two herbals focus on toxin and waste removal respectively.

**Milk thistle seed** contains a 3 tier flavonoid complex called silymarin. If there has ever been a fairly “popular” herbal among regular medicine practitioners with regards to liver repair, this is the one. Silymarin actually receives much ongoing study vs. the majority of herbals world-wide and it’s for good reason; it proves to be excellent in cleansing and protecting of the liver and gall bladder from free radical damage, toxin induced damage, blood cleansing, etc. It also aides in correcting oxidative stress. All of which a k9 with heartworms will experience and need help in making better.

The addition of **Wasabi extract** makes this product creator genius in my eyes. Here’s why:

First of all, we are not talking about the fluffy horseradish paste that is died green and rushes your sinuses when you eat it. We are referring to the fairly hard-to-find actual wasabi extract of the plant itself.

There are three unique compounds found in wasabi that are not found in any other vegetable. These are known collectively as long chain methyl Isothiocyanates – MITC for short.

Among other things, these act to boost the natural immune system of the body, also activate the liver to improve its function, and finally work to ensure that a sick body does not react adversely to the chemical attacks that are going on inside it self while healing.

On a side note, the best and most informed herbalists world-wide consider this plant to be an actual *super food* not only due to the above properties that it contributes and more, but because it is an incredible healer of **cancer** as well. This fact is not well publicized... *at all*. The last thing our western medical and FDA leaders want is to lose billions in the cancer market by allowing consumers to realize there is a better way. I'll tell ya. When it comes to major life threatening diseases, etc., knowledge is power. By all means, please-please visit this other web page if you have any needs in your family regarding cancer issues (or any other serious disease for that matter) at: [The One Minute Cure For Virtually All Diseases](#). And prepare to be amazed at what you learn. I have been apprised of the information it shares long before their website existed, so I can strongly attest to the efficacy of the remedy it speaks of. Heck it's in my freezer right now!

**Anyways.. Oh, remember;** Do not use the "Scram" formula if your female dog is pregnant. This again due to the wormwood plant properties found in this product noted earlier. Simply wait until she delivers before starting her regimen. Start the puppies approx. 5 weeks later(to kill the micros that exist in their blood).

## **Scram dosage recommendations (a ten week cycle);**

### Dogs up to 15 lbs (with heartworms);

Half a cap a day for 5 days, followed by a 3 day break. The break allows for the micros in the blood to be eliminated and removed from the system, thereby allowing for preparation for the next step. Next is a full cap a day for 5 days, a 3 day break, then a full cap for another 5 days. Finally after a 3 day break, half a cap for ten days. Begin the process all over again, starting with step 2 above for all dogs (you will need another order of Scram at this point for this sized dog)

### Dogs from 16 to to 30 lbs (with heartworms)

You will ultimately need 2 or 3 orders of scam for these bigger dogs;

1 cap a day for 5 days, 3 day break. 1.5 caps a day for 5 days, 3 day break. Then 1.5 caps a day for another 5 days, 3 day break, Finally 1 cap for ten days.

### Dogs from 31 lbs. to 55lbs;

1.5, 2, 2, 1.5

### Dogs from 55 and up:

2, 2.5, 2.5, 2

Note for all dogs *without heartworms*: each first dosage recommended above would simply be used on a weekly basis. For example; for 15 lb dog dosage would be half a cap once a week for maintenance.

\*\*Also realize that even though a heartworm can be dead in a dogs' system, it takes upwards of 6 months for a dog to test "negative" for heartworm. This due to the fact that the dissolving worm body parts ever-so-slowly dissipating still *can* show antigen existence for this period of time.

However if a dog did not have many heartworms, or maybe did not ever achieve adult heartworm hosting status (but did have the parasite non-the-less), the above noted timeline could be much quicker. As it turns out it is quite cost effective and very easy to test your dog for heartworm using the same exact tests that vets use. When you can, visit my original [test kit page here](#) to learn more, but visit this [secret back-end page](#) to receive a discount on the kit, since we are now officially in this fight together!

**Penn Herb Company**, Philadelphia, PA

[www.pennherb.com](http://www.pennherb.com)

**1-800-523-9971**

Ships world-wide

[Item no. G8C, Black Walnut and Wormwood Complex](#), by “Nature's Answer”

Penn Herb has been around since 1924! Online for 15 yrs. The product they offer can be found at the above provided link and contains a great balance of the 3 main ingredients that we have covered thus far. This tincture is non-grain alcohol based and contains anise leaves.

Unlike the others mentioned below, the company adds **Anise leaves**, and removes the alcohol for taste purposes only. Beneficially speaking, in larger quantities, Anise aids in general respiratory function.

The tiny downside is that due to the absence of the grain alcohol, this tincture's shelf life will benefit from being kept in the fridge.

**Remember-** Do not use this product if your female dog is pregnant. Simply wait until she delivers before starting her regimen.

**Tincture dosage recommendations:**

**Dogs up to 20 lbs.** should receive 3-4 drops of tincture every day for 1 week, then 4-5 drops daily for 2 more weeks. After a 5 day break from the tincture, 6 drops three days a week is ample. This once a week increment can be ongoing, until pet tests negative for worms. Placing the drops in the dog's water is a perfect way to administer any of the tinctures. You can always mix it into his food especially if its soft food that you give him/her.

**Dogs from 20 lbs. to 40lbs** can simply receive double the drops shown above on the same time cycle.

**Dogs above 40 lbs.** should receive no more than 10 drops every other day for the first two weeks followed by a 5 day hiatus, then up to 15 drops twice a week ongoing (as noted above).

For what it's worth, my 52 lb. boxer receives 15 drops, twice a month to maintain an anti-parasite lifestyle. My 27 lb. schnauzer receives 5 drops twice a month.

**Native Remedies**, Boca Raton, FL

[www.petalive.com](http://www.petalive.com)

1-877-289-1235

Ships world-wide

[SKU # PPAR001, Parasite Dr.](#) by “Native Remedies”

And

[SKU # PKDS001, Kidney Support](#) by “Native Remedies”

And if budget allows,

[SKU # PLIV001, LiverAid](#) by “Native Remedies”

Here, I am recommending two products (well, 3 actually). This company Native Remedies, located in Florida, has a separate web site built within that tailors to pets exclusively. That is Petalive.com. **They have tons of products and a huge site!** I have a strong belief in this “family owned” company due to tremendous consumer pet success stories, and the companies’ ongoing support of their community and involvement in pet rescue programs. Not to mention the knowledge that goes into their products. I have a personal database of product success ongoing, as well. Superb stuff.

**Parasite Dr.** utilizes **wormwood** and **cloves** but also incorporates the use of the **rue herb** or “**Herb of Grace**” and **Neem**. This herb is known to aid in the removal of intestinal-type parasites in a smaller scale, but it is more commonly used to aid in digestion especially in that of a parasite carrier (host). Remember that parasites affect every living being. Not just dogs! People have used it, like the others above, for many years. It also helps in cardiac repair which we could certainly assume a dog with heartworms will need.

**Neem** is also added into this product as it is an extremely popular Ayurvedic medicine. The term “Ayurvedic” simply means that something natural was/is used for thousands of years and/or originates from India. It is one of many popular Indian “traditional natural

remedies”. Hence the term given to such a medicine; Ayurveda. Neem has many benefits. It stimulates the immune system, improves liver function, detoxifies the blood, promotes healthy circulative, respiratory and digestive systems, and is well known to act as a malaria and diabetes treatment respectfully.

Neem, like oil of clove, is anti-fungal, anti-viral, anti-septic, and anti-bacterial. Having it brought into this products’ mix for your pet is JUST what he/she needs to help in **the worm/waste removal that will begin to be present throughout its body.. once you begin treatment for him that is**. Note that if heartworm removal is not done in a gentle, slow and correct manner, a canine can enter into a type of shock embolism. This is why it is crucial to get the liver, kidneys, etc. flushed and properly so. Make sure to read dosage recommendations at these different product web pages and also at the customer reviews pages to get ideas of how to administer this capsule product to your dog.

And **DO NOT** give to pregnant dogs! Herb of Grace is a huge inducer of menstrual cycles (an abortifacient). Similar to the wormwood properties I depicted earlier but stronger in-fact.

**KidneySupport and LiverAid** are 2 more an pet-specific remedies. What we are accomplishing here with these two separate bottles of product is both kidney and endocrine function, **AND** liver and urinary tract health and function in your recovering dog.

Products “Kidney support” and “LiverAid” together comprise a dynamite package. They contain as a duo; Burdock, Dandelion, Cleavers, also; Chelidonium rad, Carduus Mar, Kali Mur, Nat Phos and others. I approve the ingredients they share on each given product web page, so my recommendation is to read them there as they are just as thorough as I could write for you here.

If my beloved dog acquired heartworms, I would absolutely want him or her on this 3 tier approach to better health. Outstanding company, products and shipping speeds. You will Spend a few dollars acquiring any of the products mentioned here today but as you are beginning to sense, this natural approach *beats the heck* out of the one thousand you may spend at a vet to load your dog up with chemical!! No wonder your lil' buddy trusts you sooo unconditionally, you're smart!!

## Fun With Fleas

Some households have more trouble than others at certain times each year with fleas. I myself have walked through people's yards or living rooms for that matter, only to discover that fleas, by the dozens, are

jumping up onto my legs and/or white socks (they attract to white immensely). This infestation, at whatever level one is experiencing, can be halted essentially in a virtual blink of an eye. Ok maybe more like 2 days. Sound a bit more realistic?

First off I want to explain my household scenario briefly if I may. I have two dogs that only get exposure to a fenced back yard and if out the front door, it's for a jog around the streets of the neighborhood with my wife and I. I also have a cat that comes in and out all day long and has complete freedom outdoors (to pick up fleas from abroad, etc.) So let's use the cat in the forthcoming example.

The extremely magical product that I'm about to share with you is one that I own at my house, but have not actually needed for well over 2 or so years I guess. **BUT** remember that my pets are all on the

aforementioned products as it flows through their system 24 hours a day essentially. **And** it's those same products that kill parasites right?

If I'm a flea that hops onto my cat down the street, I'm probably going to bite her fairly quickly as I'm pretty hungry. With me so far? Good. As a flea biting this cat, I've just signed my own little death certificate and will die within mmmm, about 8 hrs or less. If I make it back into Jeff's house (my house), on the cat, my time there is short lived. And neither Jeff nor his family will ever get a real chance to meet me.

IF I'm a flea biting *your* pet in *your* yard or abroad, I'm going to flourish and lay eggs all over the yard and in your house, etc. And so will all my like kind.

The above example is the reason why no one in *my* family has ever seen a flea on the property for many years. They simply don't get a chance to show themselves! It's beautiful. Same effect with **tics** too.

I want to show you some pictures now.

They are in order from being shown:

1. Ultra close up, microscope
2. Further back but still under microscope,
3. 10 feet away
4. 150 feet away

Curious what it is ?

Here are the pics:

Pic no. 1 Looks like jagged sharp wasteland.

Pic no 2. Almost like looking down at a city filled with buildings from a plane.

And here is a 1 lb. bag of it.

Finally, a huge 14 story high mountain of it.

What is it you ask? Well, for starters it's proof that our continents were all under water at some point. You are looking at **Diatomaceous earth**. In the above picture, it is in its original form prior to it being chipped away at with trucks, etc. This is a mountain of salt and/or fresh water diatoms, (crustations/shells) that should be buried at sea when they died. But here they are; one big giant mound of shells that did-in-fact die under water long ago!!

Diatomaceous earth (we will call it DE) comes in many forms and is used all over the world. Farmers feed a certain type to cows, goats, horses, etc. for parasite cleansing among other fabulous things. Some people eat a spoonful of it daily for various reasons. Other forms are used to make filters of all types. It is incredible. That's what it is. And it's going to cost you about 15 dollars to acquire a pound or two, which will last you 2 to 3 years.

Why do you want this stuff at your house?

Because it is tasteless, odorless, flour-like smooth white powder and is harmless to any belongings in your house or yard, and there is something significant about it regarding many types of **bugs**:

**It obliterates em!** Look at the first picture. I want you to imagine that those sharp angled ominous shards of "scrap" is 6 feet tall and made of aluminum or steel. I want you to imagine that there is 100 yards of this "debris" filling a football field that you have to run or jog through barefoot and naked. Please "bare" with me now because I am having you do this as if you were a flea moving fast (as they always do), on the back of your pet. Fleas move fast so now you do too.

So; someone just threw all this junk down from above equaling 6 feet high and you gotta jog 100 yards through it. What do you think would happen to your body in this colorful example? It would get shredded and cut up and you would bleed out and die...period. That is *exactly*

what happens to any exoskeleton-type bug. Albeit a small roach, flea, ant, lice, tick, centipede, etc.

They travel through those jagged holes and it slices them up. The faster they go through the quicker they dehydrate through their cuts. Sprinkle some on your dog with fleas and within about 8 hrs you will find little shredded remains of their bodies all pulled apart and dead. Or, if you want, catch a few within about 2 or 3 hrs off of your pet and they will be abnormally fat with bellies filled with white. Because fleas and ants eat this stuff and it makes them explode too (as if we needed more ways for them to die). Neat, huh?

Just be easy sprinkling it on your carpets. You do not need near as much as you probably gonna want to put down and it will give your vacuum cleaner a real hard time getting it up later on. It chokes it. Be sparing. However, you can sprinkle this on beds under your fitted sheet every other few change times, on couches, on kids' heads with lice problems (lice move real slow) so it takes days, not hours to kill lice. Therefore apply after school and at bedtime for 5 or 6 consecutive days. Heck, have fun with it; load your kid's head up then smack it and watch the dust clouds form. Slather it on the cat and watch it roll off as they run away. Funny stuff. When I do apply it to *my* cat, she seems to know it helps and actually rolls over for me to apply it on her belly. Awwwww.

Make sure to get food grade type and buy it real cheap at **Amazon.com** or even at **feed stores** in your town. **FOOD GRADE ONLY!!** Knowledge is Power, right? If you have never used Amazon.com, you are missing out on very enjoyable shopping by the way. They became the most trusted company in the U.S. and Canada surpassing Apple in early '12 and are an impressively well-organized company. I buy from them 3 to 4 times a month easily.

We are finally wrapping up on the report and I wish to you and your pet all the good fortune that you deserve as a pet owner to rid him/her of any disease or ailment. I appreciate the level of **trust** you are taking in me on this journey as I realize trust is earned and never given. Get started with ordering your chosen products right away and begin administering your family member back to perfect health!

Remember that natural heartworm recovery takes upwards of 3 months to complete; your pet cannot run around during this time. Let him/her take a “vacation” from **any** exercise, playtime with kids, etc. REST REST REST. We don't want our pet entering any shock due to dead worm contamination (blockage of an artery - known as thromboembolism). Slow and consistent product doses. Don't be in a hurry. Just be glad you got started to begin with.

### **Some interesting facts about Mosquitos**

As promised earlier, I wanted to share with you some facts about mosquitos:

- ✚ There are over 3000 species of mosquitos worldwide, many of which won't actually bite people or dogs. The United States and Europe each inhabit only near 200 types though.
- ✚ Only female mosquitos bite and can live up to 100 days. But average closer to 50 days. Males live only about two weeks.
- ✚ Biting activity increases over 500 times during a full moon phase.

- ✚ Worldwide, mosquito-borne diseases kill more people than any other single factor. They can be carriers of malaria, yellow fever, and dengue fever in humans alone. In the United States, mosquitoes spread several types of encephalitis. The occurrence of global warming only adds to officials concerns about the infection rate rising.
  
- ✚ The infection of malaria from man to mosquito, and back to man again, and the radical multiplying of this parasite in the blood stream is extremely similar to heartworm *Microfilaria* stages of dog and mosquito. The end result though is the overwhelming manifestation in the liver and later the blood and the relentless destroying, by the parasite, of the human blood cells until death occurs.
  
- ✚ Mosquitoes locate blood hosts by scent, sight and heat. From 100 feet away (30 meters) they can smell your scent, especially the carbon dioxide (CO<sub>2</sub>) you exhale. They follow you upwind, and succeed more so in finding you due to host-odor combined with the CO<sub>2</sub>. From 30 feet away they can now see you too.
  
- ✚ Make a spray spritz of a mix of lavender and tea tree oils and use as a natural and very effective repellent for your family and pets to keep off those dreaded nasty mosquitos.

Also, if you missed the link page on my website, I highly recommend you take the time to learn about the atrocities of commercial dog food and what goes in it that can-and-will devastate your dog. You will be **glued** to it especially once you reach the 9 minute mark. The good news is that the site offers superb solutions to the quite “disgusting” dilemma. If killing heartworms and having this report is considered a number 1 priority, then this would be a real-real close number 2.
